

Holiday Programme

Web Design

HTML Basics - What is HTML?

- HTML stands for **H**yper **T**ext **M**arkup **L**anguage.
- A markup language is a set of markup tags.
- HTML documents are described by HTML tags.

HTML is written in text files

index.html

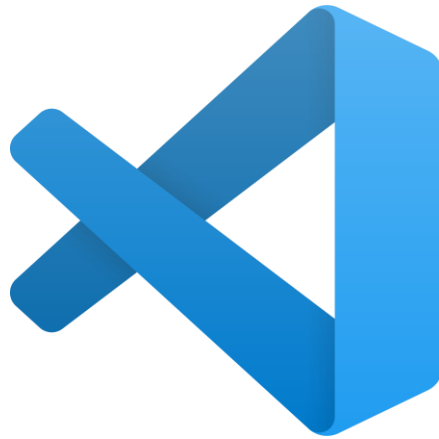

Name of the file

File extension

(tells the browser the file contains HTML)

Code Editor

Code editor – Help us write code

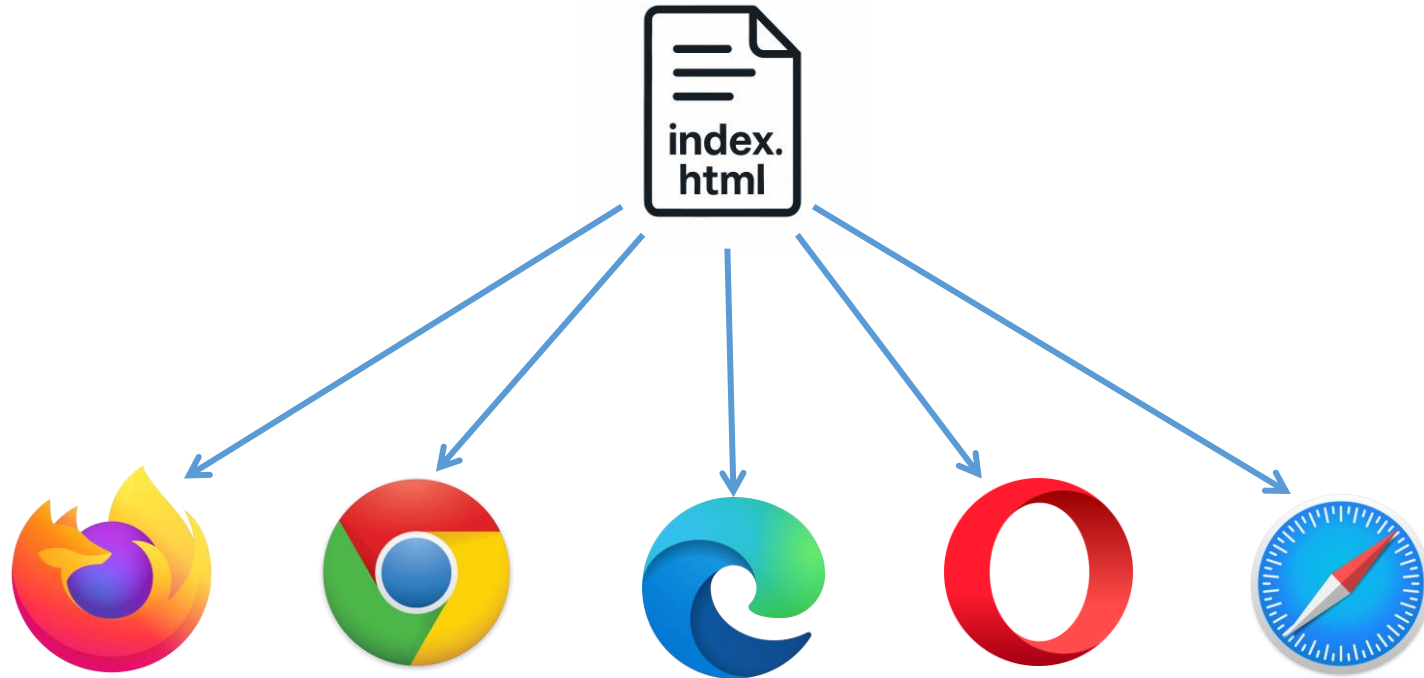

VSCode (Visual studio Code)

<https://vscode.dev/>

To display an HTML file we need a browser

- **Web Browsers** are basically "HTML Readers."
- They understand how to read HTML and display it for you.

Hopefully they all display the same thing (that's the idea)

Writing HTML

Most of the time, you'll put your content in between **HTML tags**, which have corresponding **opening** and **closing** versions.

HTML Basics – Adding images

```

```

src

This tells the browser where it can find the image file.

alt

This provides a text description of the image which describes the image if you cannot see it.

HTML Basics – demo 1

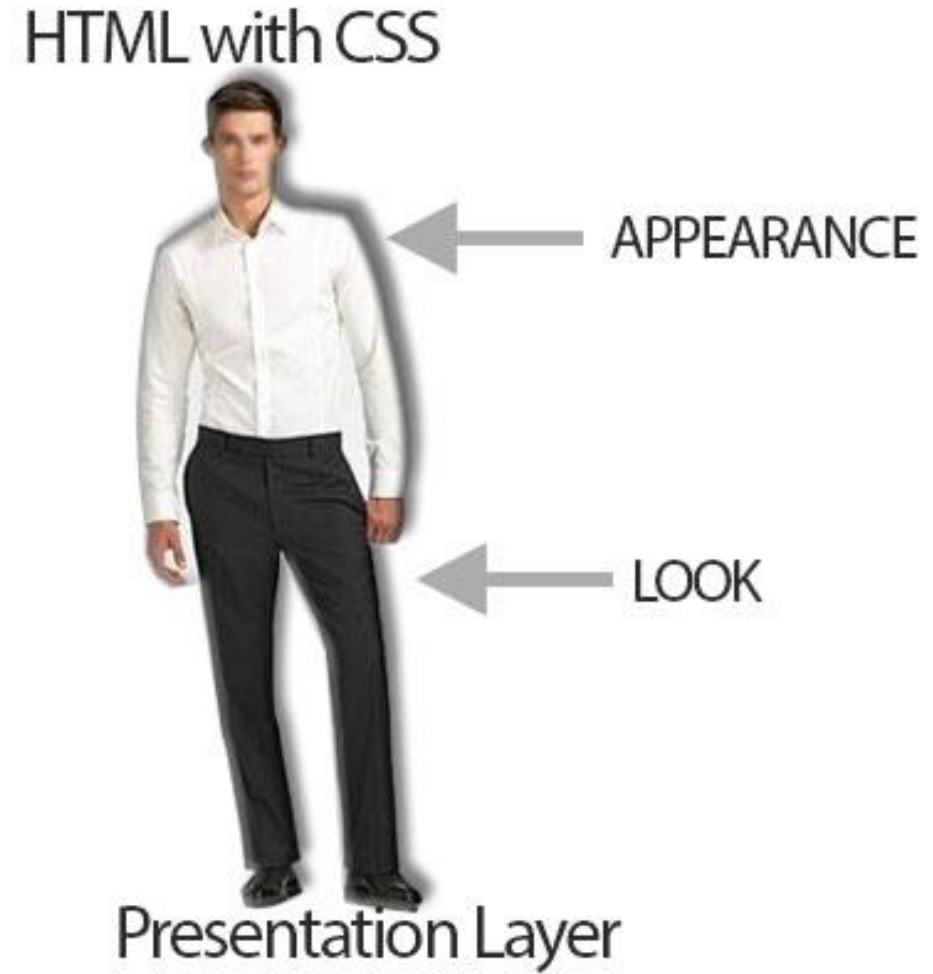

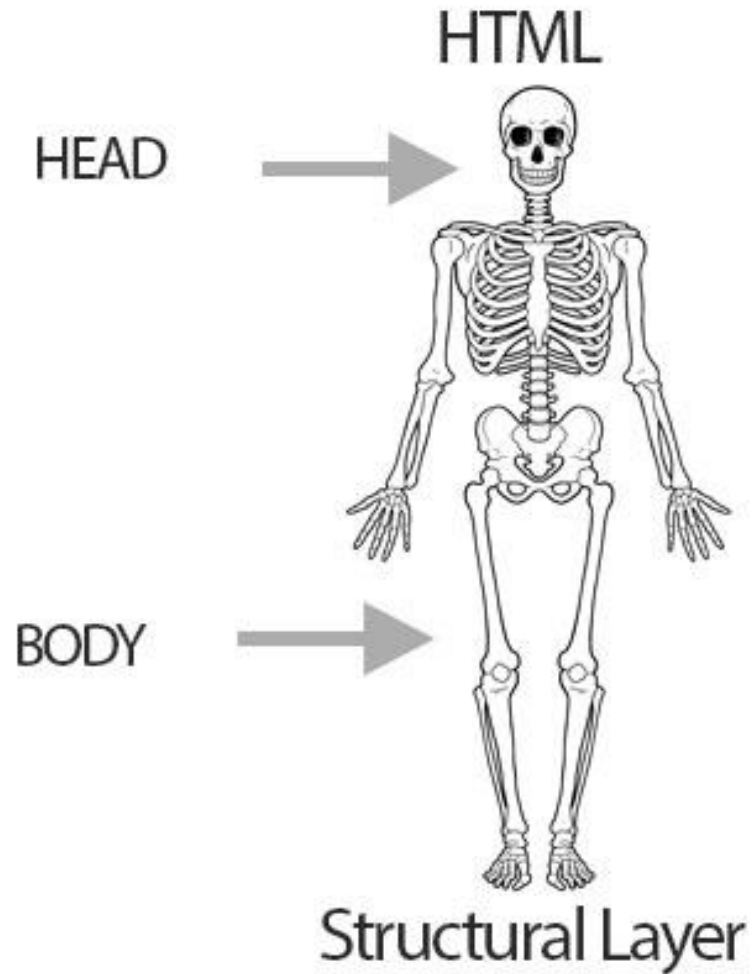

```
<style>
  img{
    width: 400px;
    border-radius: 100px;
  }
</style>
</head>
<body>
  
</body>
```

CSS Basics

- CSS - Cascading style sheets.
- Styles define how to display HTML elements.
- Change the appearance of HTML elements.
- Styles are normally stored in Style sheets.

CSS Associates Style Rules With HTML Elements

CSS works by associating rules with HTML elements. These rules govern how the content of specified elements should be displayed.

A CSS rule contains two parts: **a selector** and **a declaration**.

This rule indicates that all **<p>** elements should be shown in the Arial typeface.

Selectors indicate which element the rule applies to. The same rule can apply to more than one element if you separate the element names with commas.

Declarations indicate how the elements referred to in the selector should be styled. Declarations are split into two parts (a **property** and a **value**) and are separated by a **colon**.

CSS selectors are **case sensitive**, so they must match element names and attribute values exactly.

CSS Basics (cont.)

A CSS declaration always ends with a semicolon, and declaration groups are surrounded by curly braces:

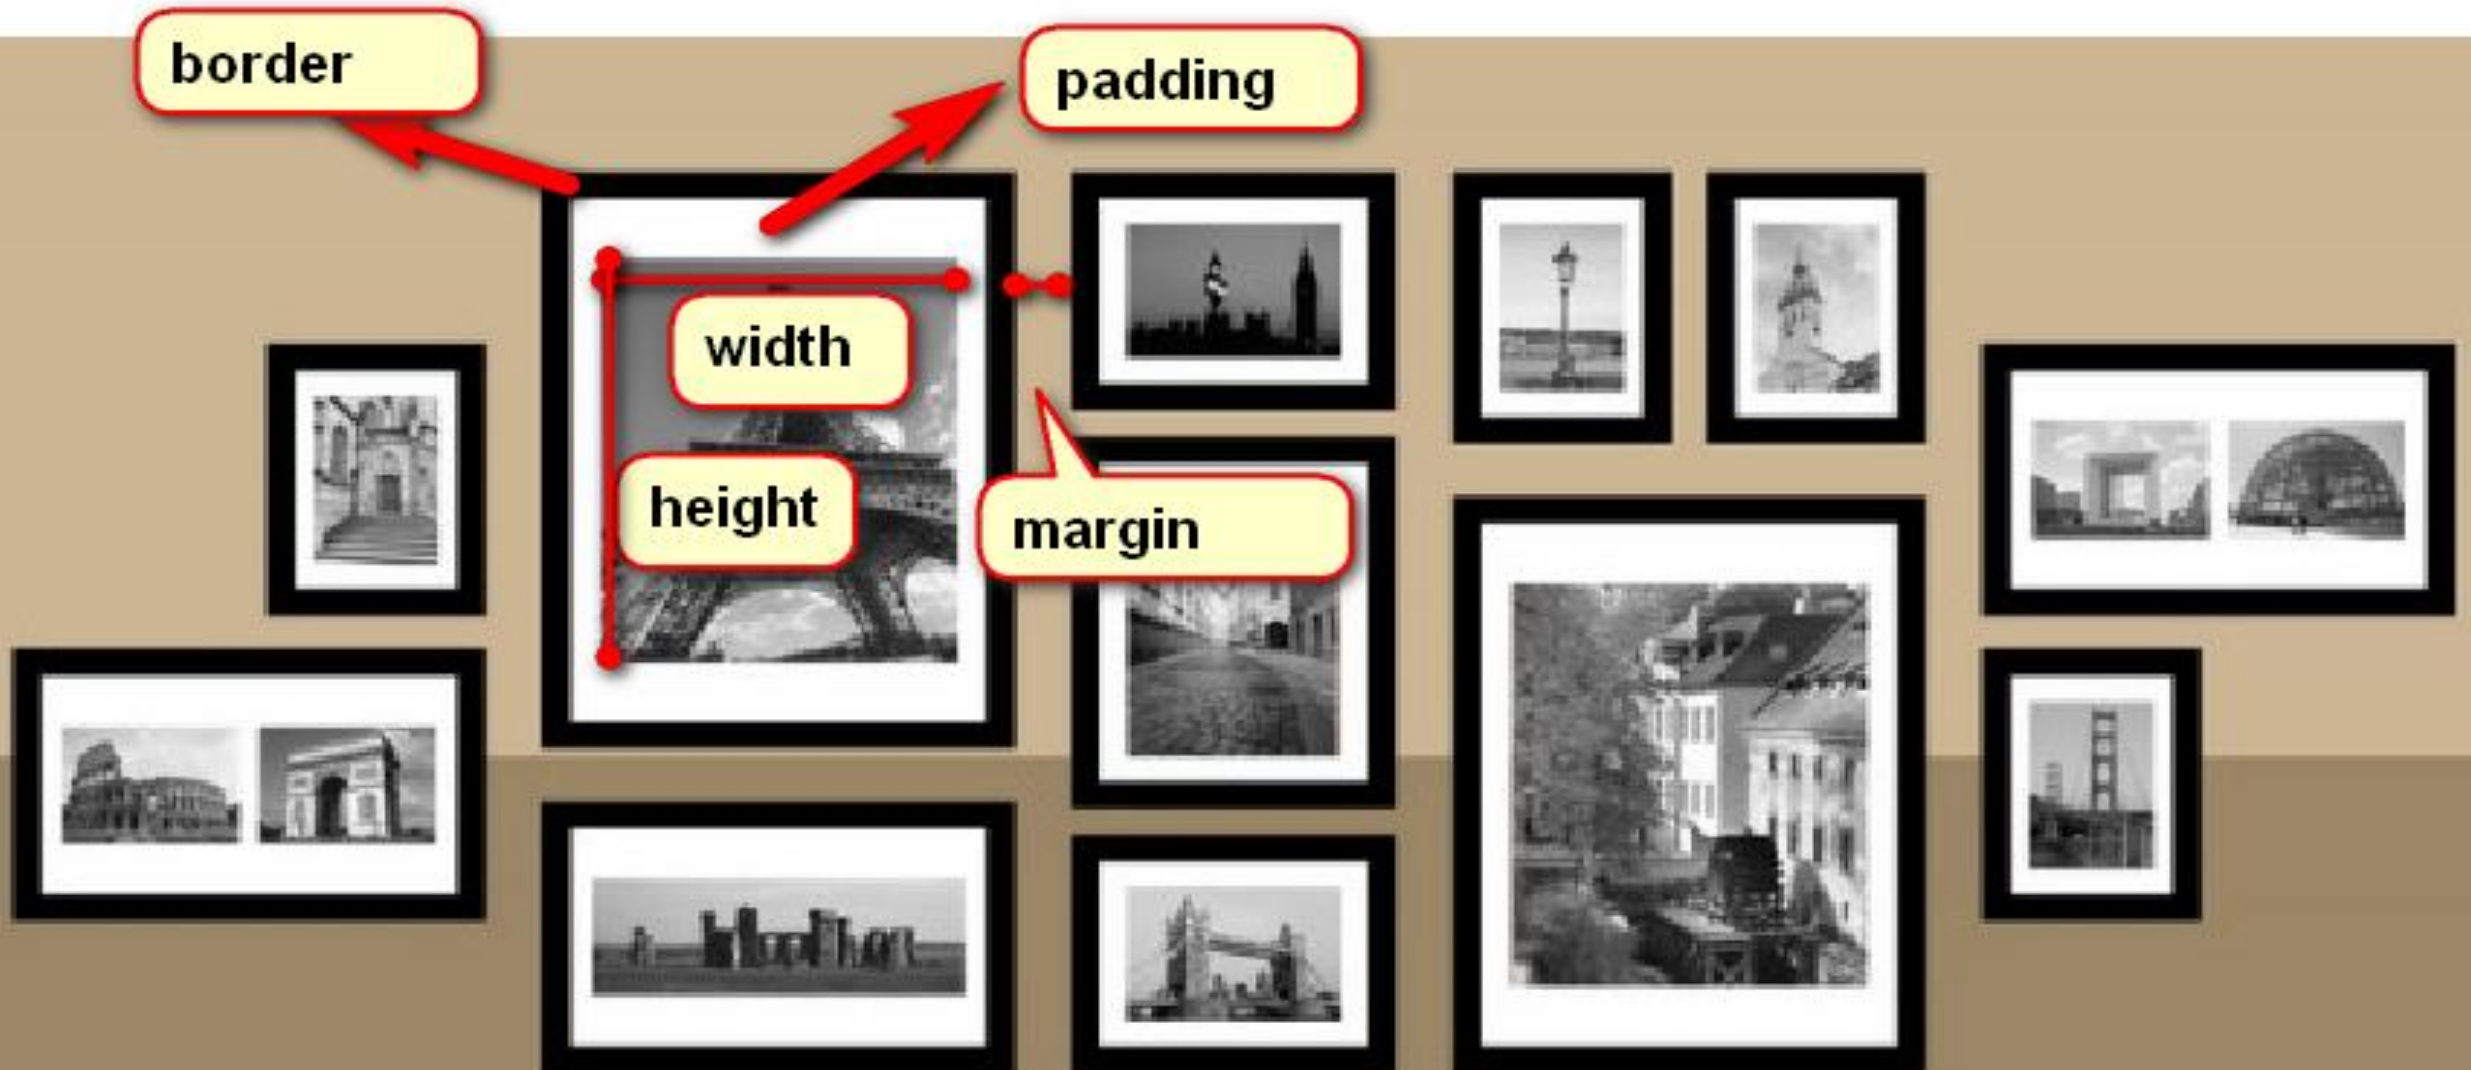

```
p {color: red; text-align: center;}
```

- To make the CSS code more readable, you can put one declaration on each line.
- In the following example all <p> elements will be center-aligned, with a red text color:

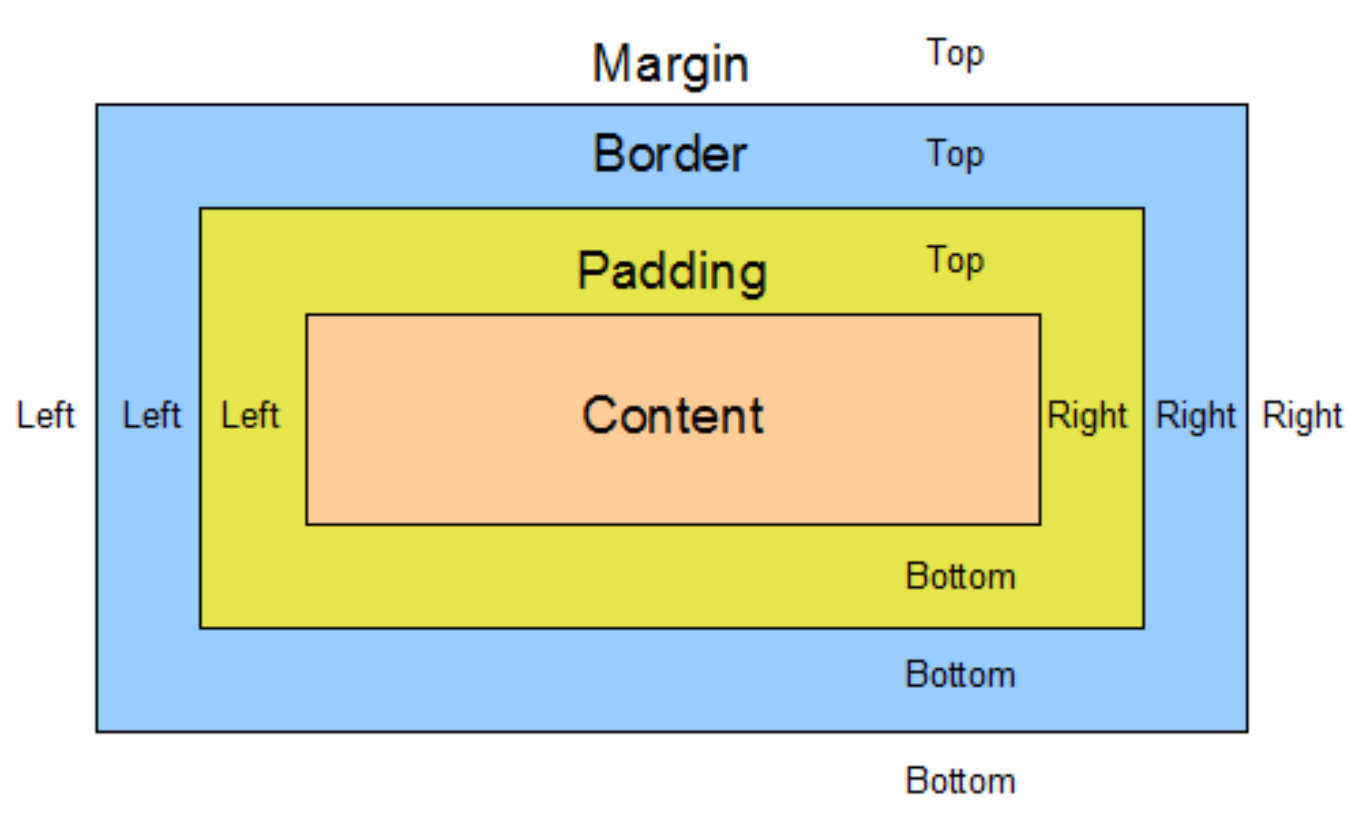

Example

```
p {  
    color: red;  
    text-align: center;  
}
```

Border, Margin & Padding

Border, Margin & Padding (cont.)

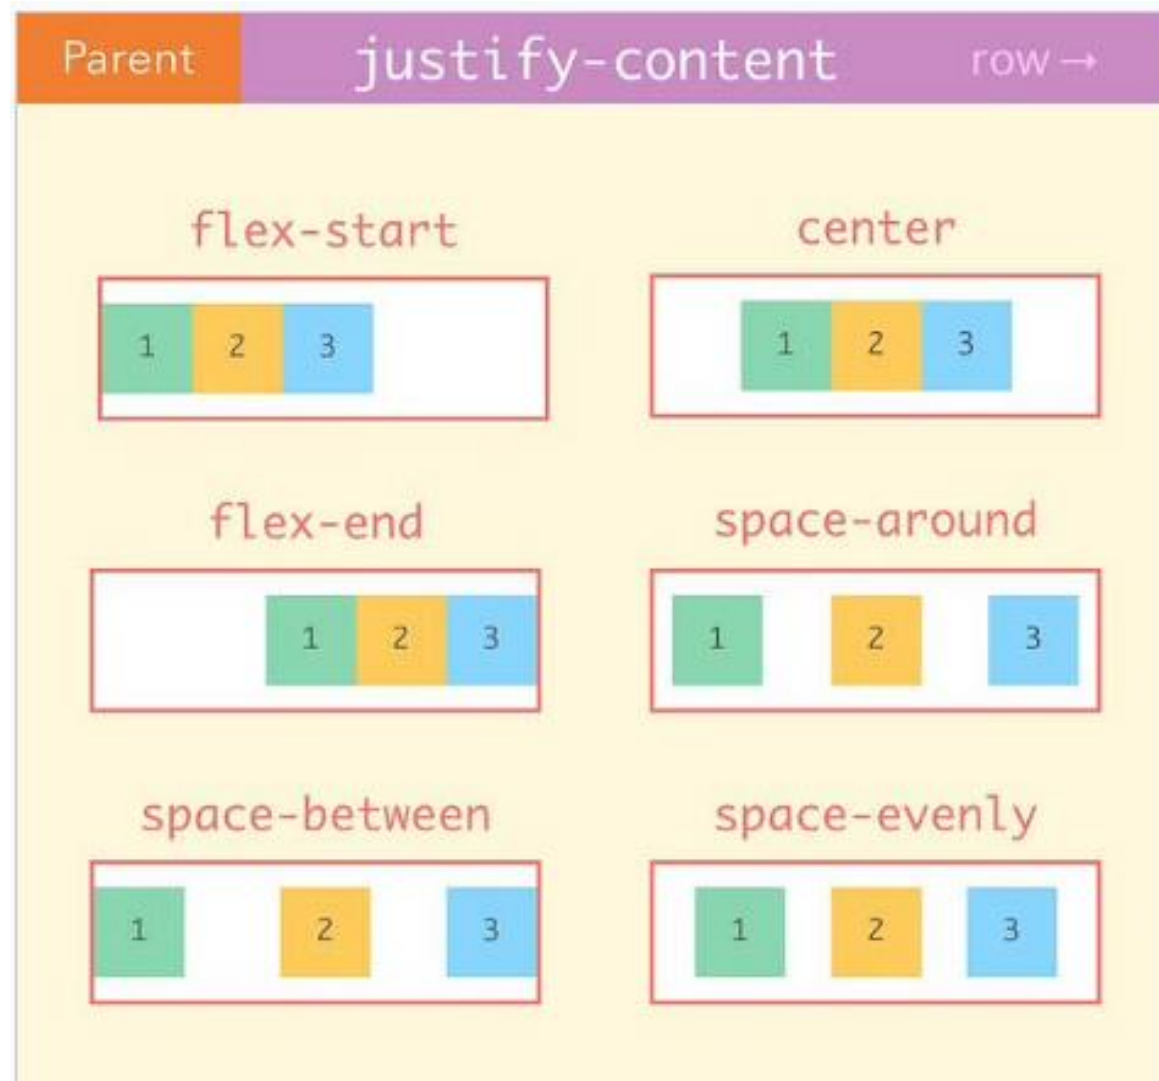

CSS Layout :flex

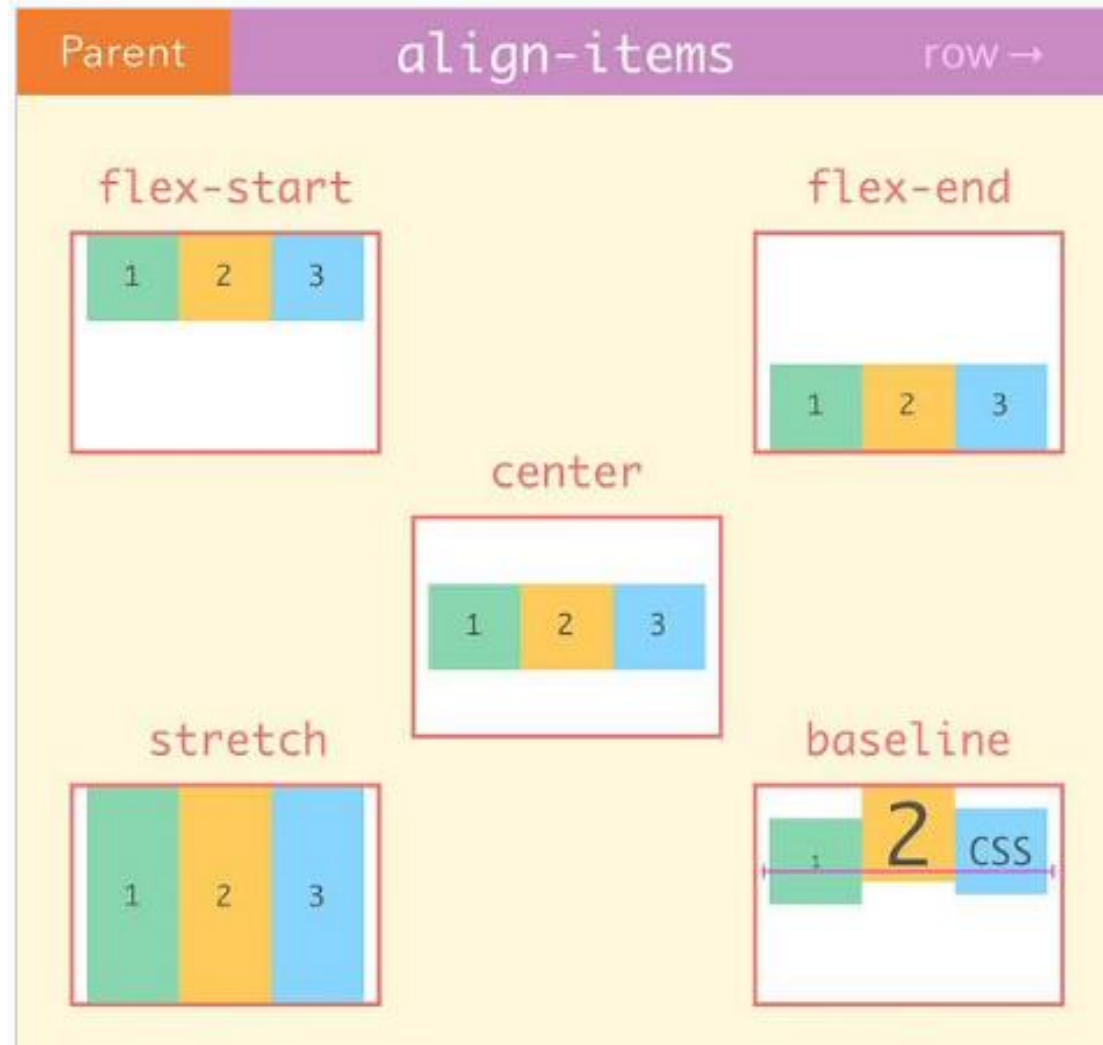

- CSS Flex is a layout model that allows design and alignment of items within a container.
- Why Flexbox: Solves complex layout challenges, improves responsiveness.

Flexbox: justify-content

align-items

CSS – Demo 2

Using various units of measure

Absolute Units

- **PX:** Pixels (px)

Relative Units

- **EM:** Relative to the parent element
- **REM:** Relative to the root element (HTML tag)
- **%:** Relative to the parent element
- **VW:** Relative to the viewport's width
- **VH:** Relative to the viewport's height

Using various units of measure - rem

one rem unit is:

Equal to the computed value of font-size on the root element.

When specified on the font-size property of the root element, the **rem** units refer to the property's initial value.

- 10px = 0.625rem
- 12px = 0.75rem
- 14px = 0.875rem
- 16px = 1rem (base)
- 18px = 1.125rem
- 20px = 1.25rem
- 24px = 1.5rem
- 30px = 1.875rem
- 32px = 2rem
